By using the NCDB, CoC-accredited programs can proactively improve delivery and quality of care for cancer patients through the comparison and evaluation of their data.

The National Cancer Database (NCDB), a joint program of the Commission on Cancer (CoC) of the American College of Surgeons and the American Cancer Society, is a nationwide database containing approximately 34 million records from hospital cancer registries.

Annually, all CoC-accredited programs are required to submit data to the NCDB. The data include, but are not limited to, patient characteristics, cancer staging and tumor histological characteristics, type of first-course treatment administered, and outcomes information. The data provided give CoC-accredited programs access to Web-based tools that enable the programs to:

- Evaluate and compare the cancer care delivered to patients diagnosed and/or treated at their facility with that provided at state, regional, and national cancer facilities
- Identify areas for quality improvement to ensure that patients receive the right treatment at the right time
- Compare quality-related performance measures with aggregated CoC-accredited programs, including accountable, quality improvement, and surveillance measures
- Assess performance with 23 quality measures across 10 disease sites, as the CoC is committed to adding new quality measures to demonstrate best practice
- Run benchmark reports to drive quality improvement and quality assurance activities
- Track and analyze data on all types of cancer to:
  - explore trends in cancer care
  - review regional and state benchmarks for CoC-accredited hospitals
  - serve as the basis for quality improvement
- Determine patients lost from or referred to their programs
Accredited programs utilize the data for:

<table>

Ensuring the highest-quality, multidisciplinary, patient-centered cancer care

1,500+ Accredited Programs

70% newly diagnosed cancer cases included annually

National Cancer Database established 1989

34 million records 2016
hospital comparison benchmark reports

provide authorized users with the ability to run personalized reports.

cases diagnosed between 2003 and 2013 are available to users, and the reports that can be run include data for all types of cancer (categorized into 73 different analytic types). users can generate three different types of reports showing:

- data reported to the ncdb from their own cancer registry
- aggregated data by hospital system, state, region, or at the national level
- comparisons of the cases submitted to the ncdb by the user’s cancer program and all the other programs identified by the user in the comparative group

comparison of stage of breast disease (sample).

stage of breast cancer diagnosed in 2003 to 2013. ncdb hospital vs. all types hospitals in all states. all diagnosed cases. data from 1,549 hospitals.

stage-stratified, five-year survival for major cancer sites (sample).

observed survival for colon. cases diagnosed in 2003–2008. data from 1,485 programs (national).

allow programs access to unadjusted american joint committee on cancer (ajcc) stage-stratified, five-year observed survival rates for all cancer sites.

users generate program-specific survival reports filtered by the primary site of the cancer and diagnosis period. display shows overall and ajcc stage-stratified rates, including 95 percent confidence intervals. in addition, users can stratify by stage and sex, age group, or comorbidity score.

please note: the commission on cancer policy does not permit public reporting of survival data.1

the reports allow the user to assess the need for screening in their community by comparing stage at presentation of disease for your program with other coc-accredited cancer programs.

Cancer Quality Improvement Program (CQIP)

Reports annual quality and outcomes data to CoC-accredited programs.

Each accredited program receives a program-specific report that can be used to conduct a retrospective review of the services provided. This information enables programs to develop plans and programs to ensure that their cancer program offers high-quality, patient-centered cancer services to prevent, screen, diagnose, treat, and monitor the population served.

Each CoC-accredited program has access to a confidential and individualized report in PowerPoint format, which includes the following items:

- **Facility Administration Reports**
  - Cancer program volume
  - Cancer program in/out migration

- **Quality Measure Estimated Performance Rates Comparisons**
  - Breast
  - Cervix
  - Colon
  - Endometrium
  - Gastric
  - Non-small cell lung
  - Ovary
  - Rectum cancer sites

- **Surgical Volume and Unadjusted 30-, 90-Day Mortality after Complex Operations**
  - Cystectomy
  - Esophagectomy
  - Gastrectomy
  - Pancreatectomy
  - Rectal resection
  - Non-small cell lung cancer resection

- **Survival Reports (Unadjusted and Adjusted)**
  - Breast
  - Colon
  - Non-small cell lung

- **Additional Facility-Level Reports**
  - Breast
  - Colon
  - Non-small cell lung cancer
  - Prostate
  - Melanoma of the skin

Participant User Files (PUF)

Review and advance the quality of care delivered to cancer patients through analyses of cases reported to the National Cancer Database.

This Health Insurance Portability and Accountability Act (HIPAA)-compliant data file contains de-identified patient-level data that do not identify hospitals, health care providers, or patients as agreed to in the Business Associate Agreement (BAA) that each CoC-accredited program signs with the American College of Surgeons. The PUFs are designed to provide investigators associated with CoC-accredited cancer programs with a data resource they can use to review and advance the quality of care delivered to cancer patients through analyses of cases reported to the NCDB. Semi-annually, the NCDB extends investigators at CoC-accredited cancer programs an opportunity to apply for a PUF.
