Join us at Clinical Congress 2021!

Adherence to technical standards is increasingly recognized as critical to achieving optimal oncologic outcomes following surgery. The *Operative Standards for Cancer Surgery* manuals, developed through the American College of Surgeons Cancer Research Program (ACS CRP), highlight evidence-based techniques and recommendations for surgical oncologists.

Use of technical standards can reduce variability in care, leading to improved quality. **This course will teach surgeons how to take technical standards from theoretical constructs and integrate them into their clinical, quality, and educational programs.**

- Sandra Wong, MD, FACS, and Thomas A. Aloia, MD, FACS, will focus on data supporting the use of technical standards and considerations in the context of value-based care
- Karl Y. Bilimoria, MD, FACS, will discuss how surgeons can use operative standards and outcome metrics to improve surgical quality
- Elizabeth G. Grubbs, MD, FACS, will demonstrate that operative standards can be an important part of education for surgical residents

A live, interactive discussion with course participants and speakers will be led by Judy Boughey, MD, FACS; Fabian Johnston, MD, FACS; Nicole Lopez, MD; and Heidi Nelson, MD, FACS
